

PRODUCT REQUIREMENTS DOCUMENT

Twilio Platform — twilio.com

Version: 3.0 | Date: September 2026 | Prepared for: Hi Tech Agentic Test Pipeline

Start URL: <https://twilio.com>

0. Global Behavioral Policies

The following policies apply to every user flow in this document. They describe how the agent should behave during test execution, what kind of interactions are expected, and how to handle environmental interruptions.

0.1 Overlay Handling

Twilio.com deploys overlapping interstitial elements: a cookie-consent banner, a live chat widget, promotional modals, and GDPR consent dialogs. Before every interaction step, the agent must dismiss any visible overlay by clicking its close control or pressing Escape, then wait for the element to be removed from the DOM.

0.2 Interaction Model

Tests in this document follow an **action** → **observe** → **verify** model. Each acceptance criterion specifies: (a) the navigation path, (b) the UI elements to interact with, (c) the input data where applicable — all self-contained so no external credentials or account details are ever required — and (d) the observable outcome to assert.

0.3 Self-Contained Test Data

Where a flow involves typing into a form field, the exact value to enter is specified inline within the acceptance criterion. The agent uses these values verbatim and does not pause to look up, generate, or request any additional information. If a page transitions to a step that asks for information not provided in the criterion, the agent stops at that boundary and records the transition as the observed outcome.

0.4 Boundary Conditions

Flows that reach a sign-in wall, email-verification gate, or payment screen treat the appearance of that gate as the final observable outcome to assert — they do not attempt to proceed past it. The acceptance criterion for such flows explicitly names the expected gate element so the agent knows when to stop and record a pass.

1. Overview

Twilio is a cloud communications platform offering programmable Voice, SMS, Email, and Video APIs. This PRD defines **1 user flow comprising 2 acceptance criteria** for the Kane-CLI agentic pipeline — trimmed to the minimum needed to validate that all pipeline stages execute correctly end-to-end.

2. Scope — 1 Flow, 2 Acceptance Criteria

- Flow 1: Homepage journey — scroll feature section, click product CTA

3. Functional Requirements

3.1 Homepage Journey

■ INTERACTION DEPTH NOTE

Each acceptance criterion in this section describes a complete user interaction journey — not just a page load check. The agent should perform each described action (click, type, scroll, hover) in sequence and verify the observable outcome at each step. All test data used in form fields is self-contained within each criterion and requires no external lookup or account-specific information.

■ OVERLAY HANDLING — apply before every interaction in this flow

Before clicking any element, scan the viewport for cookie banners, chat widgets, promotional modals, or GDPR consent dialogs. Dismiss each by clicking its labelled close control ('Accept All', 'No thanks', 'X', 'Got it') or pressing Escape. Wait for the element to disappear from the DOM before proceeding. If a widget re-opens, dismiss it again. If dismissal fails after 3 attempts, log a warning and continue.

REQ ID	Requirement	Acceptance Criteria
HM-01	Homepage renders hero section and user can scroll to the product feature cards below the fold	Agent navigates to https://twilio.com ; hero headline is visible; agent scrolls down until the product feature/card section comes into view (e.g. 'Communications APIs', 'Engage customers'); at least 3 feature cards or product tiles are visible in the viewport after scrolling.
HM-02	Primary CTA click leads to a reachable next-step page (sign-up gate or demo request form) without a 404 or blank screen	Agent clicks the primary CTA button on the homepage ('Start for free' or 'Get a demo' — whichever is present); the resulting page URL changes and a heading or form element appears on the new page; if a sign-up wall loads, the presence of an email input field is recorded as the expected boundary outcome and the test passes.

4. Test Scenarios (2 — minimum viable)

Each scenario maps to one acceptance criterion and describes the full user journey the agent must execute. All input values are embedded in the scenario description — the agent does not need to source any data from outside this document.

#	Scenario (full journey)	Req	Pri
1	Homepage: load page → scroll to feature cards → assert 3+ cards visible	HM-01	P1
2	Homepage: click primary CTA → assert new page or sign-up gate loads	HM-02	P1

5. Pipeline Configuration

- `requirements_doc`: `twilio_PRD.pdf`

- **start_url:** https://twilio.com
- **test_language:** javascript
- **max_tests_to_run:** 2

Required Secrets

- **KANE_USERNAME / KANE_ACCESS_KEY** — TestMu credentials
- **LT_USERNAME / LT_ACCESS_KEY** — LambdaTest credentials

Known Overlay Selectors on twilio.com

The following CSS selectors identify the most common overlays on twilio.com. The agent should attempt to dismiss elements matching these selectors before each interaction step:

- **#onetrust-accept-btn-handler** — cookie consent accept button
- **.truste_overlay, .truste_box_center** — TRUSTe consent box
- **[aria-label='Close'], [aria-label='Dismiss']** — generic modal close
- **.drift-frame-controller** — Drift live chat widget
- **button:contains('No thanks'), button:contains('Maybe later')** — promotional modals
